"KOHARU" - Elderly Care Manikin

● Accessories/Pajamas, Baby powder

For elderly care training in creating good relations

The "Koharu-san" doll was born to learn and nurture the kindness and affection required for nursing care. The texture of the skin, facial expressions, movements of the joints of each part of the body, body shape, etc., give off a realistic feeling as if the doll were alive. Feeling like you are actually interacting with the elderly naturally creates a sense of compassion and provides smile and happiness in nursing practice.

<Wig is sold separately>

Reproduction of the bending of the back peculiar to the elderly

In order to make it similar to the movements of the elderly, the back is made so that it can bend forward, making realistic training possible such as when sitting in a wheelchair.

The movement of legs and hip joints are smooth

Forward/backward and outward movement of the legs are more practical, and the hip joints open widely. You can also practice excretion assistance using toilet bowls and urinals in a realistic manner.

Joints are made subtle, hardly noticeable

Since it is seamless, training in bathing can be done safely and smoothly.

Durable yet easy-to-handle skin material

The skin is made of high-quality silicone, and can be used freely with a sponge, detergent and in the shower.

Features

1 The head moves in all directions (front, back, right, left)

"The head moves not only front and back, but also right and left, making practical training possible as if on a real human body."

2 The Movement of the joints are more real

A bone structure is built-in. Each joint in the shoulders, elbows, wrists, hips, thighs, knees, and ankles move rather stiffly as in the care of actual elderly people. Training in exchanging pajamas and bedding, bathing, and cleaning can be done more realistically.

Specifications

Height	150cm
Weight	About 12kg
Material	Silicone

Practice

Oral care practice

Rhythmic lifestyles

Dentures are removable, and oral care can be performed.

Training in excretion and urination

Master appropriate assistance through realistic training

Forward and backward as well as outward movement of the legs can be done freely, and the hip joints open widely. It is possible to practice not only assistance in excretion using a stool or toilet, but also in removing excrement from the anus.

Training in wheelchair assistance

The lively facial expression nurtures good relations

The joints in the hips, knees, and ankles bend, making it possible to smoothly learn the right way to offer wheelchair assistance.

Training in changing position

Realistic training through natural movement and poses

Due to the new function in the joints of each body part, assistance in getting up to prevent bedsores, balance in sitting, and changing position can be practiced more realistically.

Training in bathing

The skin is close to the actual human body resulting in tender feelings

The entire body is silicone, seamless, and full-waterproof. When practicing bathing (whole or partial), it is possible to put in actual hot water. Can also use with a sponge, detergent or in the shower.
